Introduction

1.1 Research Background & Objectives

To conduct an independent face to face survey amongst a sample of visitors to Elgin City Centre.

The main aims and objectives of the study were as follows:

- To find out respondents' main purpose for visiting;
- Food shopping patterns
- To find out how respondents travel to Elgin City Centre and how long the journey takes;
- Likely expenditure in Elgin on different categories of goods
- Attitudinal questions concerning Elgin City Centre compared to other centres.
- Respondents' demographic and postcode details were also captured.

1.2 Research Methodology

A total of 201 face to face interviews were conducted. Fieldwork was carried out between Saturday 26th July and Tuesday 7th August 2021.

Interviews were conducted using NEMS field interviewers. We engaged our resident professional field market researchers on this project, virtually all of who possess substantial experience in shopper research studies.

The interviews were subject to a 10% random back check to ensure the survey was being conducted to the required standard.

1.3 Statistical Accuracy

As with any data collection where a sample is being drawn to represent a population, there is potentially a difference between the response from the sample and the true situation in the population as a whole. Many steps have been taken to help minimise this difference (e.g. random sample selection, questionnaire construction etc) but there is always potentially a difference between the sample and population – this is known as the standard error.

The standard error can be estimated using statistical calculations based on the sample size, the population size and the level of response measured (as you would expect you can potentially get a larger error in a 50% response than say a 10% response simply because of the magnitude of the numbers).

To help understand the significance of this error, it is normally expressed as a confidence interval for the results. Clearly to have 100% accuracy of the results would require you to sample the entire population. The usual confidence interval used is 95% - this means that you can be confident that in 19 out of 20 instances the actual population behaviour will be within the confidence interval range.

For example, if 50% of a sample of 201 answers "Yes" to a question we can be 95% sure that between 43.1% and 56.9% of the population holds the same opinion (i.e. +/- 6.9%).

%age Response	95% confidence interval
10%	±4.2%.
20%	±5.0%
30%	±6.4%
40%	±6.8%
50%	±6.9%

1.4 Data Tables

Tables are presented in question order with the question number analysed shown at the top of the table. Those questions where the respondent is prompted with a list of possible answers are indicated in the question text with a suffix of [PR].

The sample size for each question and corresponding column criteria is shown at the base of each table. A description of the criteria determining to whom the question applies is shown in italics directly below the question text; if there is no such text evident then the question base is the full study sample. If the tabulated data is weighted (indicated in the header of the tabulations), in addition to the sample base, the weighted base is also shown at the bottom of each table.

Unless indicated otherwise in the footer of the tabulations, all percentages are calculated down the column. Arithmetic rounding to whole numbers may mean that columns of percentages do not sum to exactly 100%. Zero per cent denotes a percentage of less than 0.05%.

Percentages are calculated on the number of respondents and not the number of responses. This means that where more than one answer can be given to a question the sum of percentages may exceed 100%. All such multi-response questions are indicated in the tabulated by a suffix of [MR] on the question text.

Where appropriate to the question, means are shown at the bottom of response tables. These are calculated in one of two ways: if the data is captured to a coded response a weighted mean is calculated and the code weightings are shown as a prefix above the question text; if actual specific values were captured from respondents these individual numbers are used to calculate the mean.

Appendix 2:

Sample Questionnaire

Appendix 3:

Interview location points

Eigin interviewing Locations

Ligin interviewing Locations

Site 1 is opposite the entrance to St Giles centre – the retail mall.

Site 2 is on the principal link (although there are a number) between the main high street shops and the bus station and the subway linking to the parking/shopping north of the A96.

Sites 3 & 4. These are secondary locations but have different characteristics: Batchen Street (site 3) is a more specialised retail location and can provide links to the southern part of the TC. Site 4 is just east of the main pedestrianised part and should pick up some walking to/from the Council offices – which is the largest employer in the centre.

Sites 1 to 3 will definitely have the most footfall. Don't be surprised if its busier at Site 2 than at Site 1 outside the St Giles centre.

Site 2 on North Street is currently closed to through traffic due to building works at the Poundland building. It is still very busy with pedestrians but there is a pinch point at the High Street end where everyone has to squeeze through the building site enclosure and the buildings on a narrow pavement!

Site 3 at the northern end of Batchen Street should have a good flow of people not only going up Batchen Street but also passing between the High Street and the TK Maxx on Thunderton Place. The southern end of Batchen Street would be less busy.

Site 4 is likely to be the quietest. Most likely to be busier at a lunch time when Council office workers are out picking up lunch etc.
